Funded postdoctoral position in bioinformatics

A one-year, bioinformatics postdoctoral position is currently available with the Tagare Lab in the School of Medicine at Yale University (New Haven, CT, USA). This position will involve quantitatively mining a genetic database containing Parkinson's Disease subjects and relating genetic information to image and clinical data. The work is strictly computational (i.e., no wet lab work). The ideal candidate for this position has strong programming and modeling skills, with an interest in biological problems. The position is available immediately and is funded for the duration of one year with the possibility of extension, depending on performance and available funding.

If you are interested in the postdoctoral position, please send your CV and one publication to Professor Hemant Tagare (hemant.tagare@yale.edu).
